

## FlowCore – Configuring User Access

# Configuring User Access

### Overview

Use the **User Access** settings in FlowCore to add users to a project and assign the permissions they need to perform their tasks. Project administrators can assign predefined roles based on each user's responsibilities.

Configure user access when a new team member joins a project, when a user's responsibilities change, or when you need to update their project permissions.

### Before you begin

- You must have Project Administrator permissions.
- The project must already exist.
- The user must have an active FlowCore account.

### Procedure

1. Sign in to FlowCore.
2. Open the required project.
3. Select **Settings**.
4. Select **Users and Permissions**.
5. Select **Add User**.
6. Enter the user's email address.
7. Select the required role.
8. Select **Save**.

### Result

FlowCore adds the user to the project with the selected permissions.

### Verify the configuration

1. In Users and Permissions, locate the user you added.
2. Verify that the user's email address and assigned role are correct.
3. Ask the user to sign in to FlowCore and open the project.
4. Confirm that the user can access the features permitted by the assigned role.

If the user cannot access the project or the required features, verify that the correct role is assigned and that the user's FlowCore account is active.
